Field Crops

MultiFIX™ The Optimum Food for Microbes

SUGGESTED APPLICATION GUIDE CORN · MAIZE · SOYBEAN · WHEAT · RICE · OATS · RICE

Crop value and economics dictate the application rate.
15 gallons has been used on high yielding strawberry fields.

Combine MultiFIX™ with the proper plant fertilizer, nutrient and weed/pest management programs for maximum yield and quality.

Field Crops – Rates are based on crop income potential.
Pre-plant will help with germination and/or side dress.

Good - The MultiFIX can be used at rates of minimum of 24oz. per acre with some results.

Better - The rate of 32 oz. to 48oz. per acre will result in better production and crop quality.

Best - 48 oz. to 64oz. per acre split into several applications.

General Suggestions:

MultiFIX™ should be applied several times per year depending on the crop. MultiFIX™ can be tank mixed with fertilizers, herbicides or other pesticides. (A jar test is recommended when mixing additional agricultural products). MultiFIX™ requires no agitation. MultiFIX™ may also be applied safely through micro-irrigation systems, drip-sprinkler systems or flood irrigation. Broadcast may have advantages over banding in field crops. Mechanical or irrigation/rainfall incorporation is recommended within ten days of open surface soil applications. (Incorporate into soil immediately in temperatures above 85°F, 29°C.)

MIXING: MultiFIX™ should be introduced into the tank as follows:

1. Water
2. Fertilizer and/or Pesticide
3. MultiFIX™ - Feeds microbes but does not contain live microbes.

Repeat each season for best results and benefit from the cumulative affects of the MultiFIX product on the soil, plants and crops.
